SUMMARY

Computer Science undergraduate (B.Tech, 2028) with hands-on experience building production Python backends and REST APIs. Developed a Gemini-powered backend pipeline during a Generative AI internship, using a Pinecone vector database for similarity search and response caching. Skilled in Flask, FastAPI, SQL databases (PostgreSQL, SQLite, MySQL) and Git-based collaboration, with merged pull requests in open source. Team Lead at Smart India Hackathon 2026 and NASA Space Apps Challenge Global Nominee (top teams from 11,500+ participants).

EDUCATION

DR. A.P.J Abdul Kalam Technical University — City, India
B.Tech, Computer Science & Engineering; CGPA: 7.3/10 — *2024 – 2028*

EXPERIENCE

CSRBOX — June 2026 – August 2026
Generative AI and Cloud Computing Intern — *Remote*

- Designed and deployed a Python backend pipeline for **Cloud 9**, an AI assistant, routing user queries to **Google Gemini** and serving live traffic from an **AWS EC2** instance.
- Built a feedback-driven knowledge base using **Pinecone**, persisting Gemini responses as vector embeddings only when marked helpful, and discarding negative-feedback responses to keep the data store clean.
- Implemented embedding-based similarity search to serve repeated or similar queries directly from Pinecone instead of triggering a new API call, cutting redundant external calls and lowering latency.

OPEN SOURCE CONTRIBUTIONS

pocketpaw/pocketpaw | *Python* — April 2026

- Engineered automatic port-fallback logic with socket-level pre-checks across ports 8888–8897, catching EADDRINUSE/WinError 10048 to eliminate cross-platform startup crashes (PR #906, merged).
- Fixed a dark-mode rendering bug in a select dropdown component, restoring consistent UI theming across the app (PR #845, merged).

PROJECTS

BharatRitu | *Next.js, TypeScript, REST APIs, Open-Meteo API* — Smart India Hackathon 2026

- Built REST API endpoints (GET, POST, PATCH) with Next.js Route Handlers and TypeScript for a crowd-sourced weather-event reporting platform; each citizen report is validated, geocoded and passed through a multi-stage verification pipeline.
- Designed a weighted credibility-scoring engine combining four signals (live-weather match, source trust, corroboration and location confidence) to automatically mark each report as Verified, Under Review or Flagged.
- Integrated the Open-Meteo weather API with a 5-second timeout and a fail-soft fallback, so a third-party outage never blocks a report submission.

Track Your Finances | *Python, Flask, SQLAlchemy, SQLite, Jinja2, Chart.js*

- Built Flask routes and blueprints handling expense submission, retrieval and filtering across the full request-response cycle, backed by a relational SQLite schema via SQLAlchemy.
- Implemented CSV export and integrated Chart.js to render interactive, filterable spending breakdowns by category and time period.

AirQuality | *CesiumJS, JavaScript* — NASA Space Apps Challenge

- Integrated real-world AQI datasets into a CesiumJS 3D globe with interactive controls for real-time global exploration; designed and delivered the project presentation deck.
- Selected as **Global Nominee** out of 11,500+ participants across 167+ countries.

TECHNICAL SKILLS

Languages: Python, C++, TypeScript, JavaScript
Backend & Web: Flask, Next.js, REST APIs, SQLAlchemy, Jinja2, HTML, CSS, Chart.js, CesiumJS
Databases: SQLite, MySQL, Pinecone (vector database)
AI / LLM: Google Gemini API, vector embeddings, similarity search
Tools & Practice: Git, GitHub, VS Code, AWS EC2; 30+ LeetCode problems solved, practicing DSA consistently
